

HIFEM Body Sculpting Machine

Muscles account for about 35% of the human body, and most weight loss instruments on the market only focus on fat and not on muscle. Currently, only injections and surgery can be used to improve the shape of the buttocks. The HIFEM beauty instrument adopts non-invasive HIFEM technology, releases high-frequency magnetic vibration energy through two large treatment handles, penetrates into the muscle 8cm, induces continuous muscle expansion and contraction, realizes high-frequency extreme training, and achieves the growth of myofibrils (muscle enlargement), And generate new collagen chains and muscle fibers (muscle hyperplasia). thus training and increasing muscle density and volume.

Advantage

1. It can set different muscle training modes.
2. 180 radian handle design, more suitable for arm and thigh curve design, easy to operation.
3. Saving time and effort, only lying down for 30 minutes = 30000 muscle contractions (equivalent to 30000 belly rolls / squats)
4. It's simple operation and bandage type. The operating head only needs to be placed on the operating part of the guest, and it can be reinforced with a special equipment band, without the need for a beautician to operate the instrument, which is convenient and simple.
5. It's non-invasive, and the process is easy and comfortable. Just lie down and experience it like a muscle is sucked up.
6. There are sufficient experimental studies to prove that the treatment effect is remarkable. It only takes 4 treatments within two weeks, and every half an hour, you can see the effect of reshaping the lines in the treatment site.
7. The air cooling device prevents the treatment head from generating high temperature, The handle can work continuously for a long time, which greatly improves the service life and safety factor of the machine. and greatly improves the stability of energy output.
